PRODUCT PROPOSAL · 11 NOVEMBER 2026

AstroGuide Consultation Portals

A practical plan for a customer experience, an astrologer workspace, and a secure admin portal—with optional paid calls to a human astrologer.

Customer portal | Astrologer portal | Admin portal | Voice consultation

Recommendation

Keep AstroGuide's current chart and AI reading journey. Add a clearly separate "Talk to an astrologer" marketplace so customers can choose a verified expert and start a transparently priced call.

Prepared for AstroGuide based on the current Angular + FastAPI project and the reading-result screen shared by the product owner.

01 · BENCHMARK AND PRODUCT DIRECTION

What to learn from AstroTalk

AstroTalk's public Google Play listing describes a marketplace where customers can browse astrologers and start chat or call consultations. It describes recharging a wallet before a call and charging for consultations per minute. It also lists live sessions and other astrology services.

This is a review of public customer-facing information—not a claim about AstroTalk's internal software, admin tools, call provider, or exact current rates.

Observed public pattern	AstroGuide adaptation
Customer chooses an astrologer and can begin a call or chat.	Make expert profiles, language, availability, consultation type, and price easy to compare before starting.
Wallet recharge precedes a paid call; call/chat is priced per minute.	Show the rate and estimated available minutes first. Reserve funds and keep an auditable charge/refund ledger.
Live astrologer sessions are also promoted.	Defer group/live events until one-to-one consultations are reliable and supported operationally.

> **Do not copy the product.** Reuse only common marketplace ideas. Keep AstroGuide's warm gold/ivory design, multilingual plain-language guidance, birth-chart context, and clear separation between AI-generated readings and human consultations.

Current AstroGuide baseline

- Frontend: Angular application with customer sign-in, dashboard, reading, and history routes.
- Backend: FastAPI API with SQLAlchemy models and existing account, birth-detail, astrology, and guidance endpoints.
- Current user records contain account and language details; the inspected model has no astrologer profile or role-management fields.
- There are no marketplace, consultation-call, astrologer portal, or admin portal routes in the inspected route/API registration.

02 · CUSTOMER AND ASTROLOGER EXPERIENCE

Three portals, one consistent product

Customer portal

- Keep the current dashboard and reading-result design as the home for AI/chart guidance.
- Add a clear “Talk to an astrologer” entry and a separate expert directory.
- Filter experts by topic, language, availability, rating, and displayed price.
- Profile page: verified status, experience, languages, specialties, rating, rate, and availability.
- Show wallet balance and estimated call minutes before confirming; require an explicit confirmation.
- After a call: show duration, itemized charge, expert, rating/review, and support link.
- Consultation history and receipts must remain separate from AI reading history.

Astrologer portal

- Application and identity/credential verification status; profile edits require review.
- Availability switch, working hours, supported languages, specialties, and consultation rate.
- Incoming call request with customer’s selected topic and a clear accept/decline action.
- Consultation workspace with connection state, timer, and safe end-call control.
- Earnings, completed sessions, ratings, payout status, and downloadable statements.
- Support/dispute workflow; show only the customer details required for the consultation.

Portal access: use one Angular application initially, with role-protected route groups. Keep customer, astrologer, and admin permissions enforced by FastAPI on every API—not only hidden in the UI.

Suggested route groups

Customer: /astrologers · /astrologers/:id · /wallet · /consultations · /consultations/:id
Astrologer: /astrologer/home · /astrologer/profile · /astrologer/availability · /astrologer/earnings
Admin: /admin/overview · /admin/experts · /admin/consultations · /admin/payments · /admin/reports

Safe, understandable call flow

1. **Choose:** customer opens a verified astrologer profile and sees the per-minute price, language, and availability.
2. **Confirm:** app shows current wallet balance, estimated minutes, minimum charge, and cancellation/refund terms.
3. **Reserve:** backend atomically reserves enough wallet balance for a short initial session; it rejects a call if funds are insufficient.
4. **Connect:** backend creates a short-lived, single-use call token with a voice provider. Do not expose personal phone numbers or provider secrets.
5. **Meter:** server/provider events track the call. Display elapsed time and remaining balance; warn before a balance limit.
6. **End and settle:** provider webhook ends the session; backend reconciles actual duration, captures the charge, releases unused reserve, and records the expert share.
7. **Close:** customer gets an itemized receipt and optional rating; disputes and refunds are handled from the admin portal.

Admin portal essentials

Expert operations
Review applications and documents; approve, suspend, or reject experts; manage profile visibility, categories, languages, and featured placement.

Commercial controls
Configure rate boundaries, minimum/maximum session settings, commission, refund rules, and payout approval—with change history.

Support and trust
Search sessions and payment references; review user-reported issues; issue reason-coded refunds; retain an audit trail.

Monitoring
Track call connection failures, provider webhook delay, wallet mismatches, cancellations, refund rate, and expert availability.

> **Important:** never rely on a browser timer to calculate money. Server-side session events and idempotent billing records are the source of truth. Do not record calls unless there is a clear legal basis, explicit consent, and retention policy.

Build it in safe stages

Stage	Deliverable	Ready when…
1. Foundation	Role/permission model, expert profiles, application review, admin route protection.	Unauthorised users cannot access expert/admin APIs; approved experts can publish a profile.
2. Directory	Customer expert discovery, filters, profile page, availability, ratings, rate display.	Customers can find and compare an available expert and understand the price before purchase.
3. Wallet and calls	Payment integration, immutable ledger, balance reservation, call provider, duration settlement, refunds.	Duplicate callbacks cannot double-charge; disconnects and insufficient balance settle safely.
4. Operations	Astrologer earnings/payouts, admin reporting, support/disputes, notifications, reliability dashboards.	Support can trace every consultation from payment through payout/refund.

Recommended backend building blocks

Keep Angular and FastAPI. Add SQLAlchemy entities for **roles/permissions**, **astrologer_profiles**, **expert_documents**, **availability_slots**, **wallet_transactions**, **consultations**, **consultation_events**, **reviews**, and **payouts**. Store money as integer paise, not floating-point values. Add database migrations and role/API tests with each stage.

Integrate a voice provider behind a small backend service. Select the provider only after confirming India number coverage, call masking/in-app options, per-minute cost, webhook reliability, support, and applicable privacy/telecom requirements. Keep provider credentials on the server.

Decisions required before paid launch

- Call type: in-app VoIP, masked phone call, or both.
- Currency, price display (including taxes), minimum charge, minute rounding, and maximum call duration.
- Refund rules for no-answer, failed connection, early disconnect, and customer complaints.
- Expert verification requirements, commission, payout cycle, and tax/compliance responsibilities.
- Whether chat, scheduling, video, recording, and group live sessions are launch scope or later work.

Recommended first release

Start with: expert applications + admin approval, a customer directory/profile, online availability, wallet top-up, one-to-one audio calls, per-minute billing, receipts, and support/refund handling. Keep existing AI guidance unchanged and clearly labeled.

Non-negotiable safeguards

- Server-side role checks and least-privilege admin access; admin actions are logged.
- Ledger-based money movement with idempotent payment and call webhooks; reconciliation reports.
- Explicit prices and terms before a customer starts a paid session; no hidden charges.
- Protect birth details and consultation content; define retention, deletion, consent, and support access.
- Do not promise that astrology outcomes are guaranteed; keep appropriate service disclaimers visible.

Public benchmark source

Google Play listing for AstroTalk, reviewed 11 November 2026. The listing describes chat/call consultations, wallet recharge before a call, per-minute service charges, and live sessions.

https://play.google.com/store/apps/details?id=com.astrotalk

Benchmark scope: public customer-facing listing only. Product terms, promotions, prices, and availability may change by market and over time; verify them directly before finalizing AstroGuide's commercial rules.

Codebase facts used

Inspected AstroGuide Angular routes, FastAPI router, and SQLAlchemy User model on 11 November 2026. The proposal describes new portal and marketplace capabilities; it does not claim they are already implemented.

Proposal only This PDF is a product/architecture plan, not an implementation or a commitment to third-party provider pricing.
